

Blender Snowman – Makerspace Questions

Questions

1. **What is the Outliner in Blender, and how does it help you manage objects in a scene?**
2. **How are collections used in the video to organize objects? Name one way to move an object into a collection.**
3. **Why does the video use an icosphere instead of a UV sphere to make the snowball?**
4. **Which keyboard shortcuts are shown in the video for hiding and showing objects, and what does each one do?**
5. **How does the Displace modifier change the snowball, and why is it important to apply scale after resizing it?**

Answer Key

1. **The Outliner is used to view and manage all objects and data in a Blender scene.** It helps organize objects, select them easily, rename them, and control visibility.
2. **Collections are used like folders to group and organize objects.** One way to move an object into a collection is by selecting it and pressing **M**, then choosing a collection.
3. **An icosphere is used because it has more even geometry.** This helps create better and more realistic displacement when making the snowball look lumpy.
4.
 - **H** hides selected objects
 - **Alt + H** unhides all hidden objects
 - **Shift + H** hides everything except the selected object
5. **The Displace modifier makes the snowball look bumpy and realistic.** Applying scale is important so the displacement texture looks the same size on all snowballs after resizing.
